Highlights

- The World Bank Group in 2013 made the elimination of extreme poverty by 2030 a central institutional focus and purpose. This evaluation, conducted by the Independent Evaluation Group of the World Bank Group, examines how, and how well, the Bank uses feedback loops to enhance the poverty focus of its operations. Feedback loops are important for every element of the causal chain running from data, to diagnostics, to strategy formulation and finally to strategy implementation. The evaluation uses a range of instruments, including surveys of stakeholders and World Bank staff, focus group meetings, country case studies and systematic reviews of Bank lending and non-lending operations. We find that while the Bank generates useful information on poverty reduction from its projects and programs, the feedback loops—from outcomes to data analysis to diagnostics to strategy formulation and implementation—have generally been weak, with sizable variation across countries.

Abstract

The World Bank Group in 2013 made the elimination of extreme poverty by 2030 a central institutional focus and purpose. This evaluation, conducted by the Independent Evaluation Group of the World Bank Group, examines how, and how well, the Bank uses feedback loops to enhance the poverty focus of its operations. Feedback loops are important for every element of the causal chain running from data, to diagnostics, to strategy formulation and finally to strategy implementation. The evaluation uses a range of instruments, including surveys of stakeholders and World Bank staff, focus group meetings, country case studies and systematic reviews of Bank lending and non-lending operations. We find that while the Bank generates useful information on poverty reduction from its projects and programs, the feedback loops—from outcomes to data analysis to diagnostics to strategy formulation and implementation—have generally been weak, with sizable variation across countries.

Keywords: World Bank, Poverty Focus, Feedback Loops, Monitoring and Evaluation, Learning.

1. Introduction

In 2013 the World Bank² set as one of its goals the reduction of extreme poverty to 3 percent of the world population by 2030. However, under plausible assumptions, growth alone will be insufficient to reach the targets, so new solutions will be needed that go beyond stimulating growth. Distributional changes will almost certainly be necessary.³

Achieving the goal of eliminating extreme poverty will require concerted action first and foremost by developing countries, and in supporting fashion from other members of the international development community, including the World Bank. The typical levers that a multilateral development bank has start with lending but they also include analytical work, convening power, technical assistance, capacity building, and policy dialogue. However, the financial influence of the Bank and other development partners has steadily decreased, dwarfed by much larger international capital flows, mainly from the private sector. With this diminishing financial influence, the World Bank's effectiveness in poverty reduction will have to improve if it is to meet its goals.

But how well has the World Bank in fact done in helping to reduce poverty? An answer to this question is not easy. There are of course many dimensions of the link between World Bank interventions and poverty reduction. One aspect is whether the intervention is intended to reduce poverty directly (cash transfers, social safety nets, etc) or indirectly (access to infrastructure, access to land, access to markets, etc). In the first case, the impact of interventions can be seen in the short/medium term and here tracking project outcomes to monitor direct indicators for poverty is a possible route. For long term interventions, however, monitoring direct poverty indicators is going to be helpful only in the long run. Moreover, attribution of a poverty outcome specifically to the World Bank is problematic given the many other factors than World Bank interventions which can impact poverty. Finally, an evaluation requires a full examination of the impact of the Bank's operations on each stage of a causal chain which goes from data, to diagnostics, to strategy formulation, to strategy implementation, to outcomes. Further, at each stage of the chain we would have to assess the feedback loops used by the Bank to update and alter its operations.

Nevertheless, even given all these well known issues with evaluation and attribution, we believe it is useful and important to attempt to assess the poverty focus of the World Bank's interventions, especially given its recently reformulated goals. The full evaluation is presented in IEG (2015a). This paper, however, provides a focused assessment of a key element—the feedback loops which help to enhance the Bank's focus on poverty. The evaluation is for all countries receiving support from the two World Bank arms IBRD and IDA, as well as “blend” countries that get assistance from both, and covers the period 2004-2012.⁴

The plan of the paper is as follows. Section 2 gives some background to the Independent Evaluation Group (IEG) of the World Bank and sets out the evaluation methodology. The next four

sections cover in sequence different aspects of feedback loops: Project Level Monitoring and Evaluation (M&E); Country Level Results Monitoring and Learning; Strengths and Weaknesses of the Feedback Loops across Countries; and Stakeholder Consultation and Coordination. Section 6 concludes.

2. Evaluation Methodology

The Independent Evaluation Group (IEG) of the World Bank Group is charged with independently evaluating the activities of IBRD and IDA. IEG reports directly to the Board of Executive Directors, which oversees IEG's work, preventing Bank management from altering study findings or blocking their release. The Director-General (DG) appointment and that of staff at the director level is the last appointment anyone can have in the World Bank Group —after finishing at the IEG. This independence allows IEG to address accountability issues and to make recommendations based on evidence based lessons of experience.

Each of the World Bank's activities, and the deployment of the totality of instruments in a sector, or in a country as a whole, comes under the evaluation mandate of IEG. The World Bank provides project finance through its Investment Lending instrument; budgetary support through Development Policy Loans for policy reform; analysis and policy recommendations through a range of instruments such a Poverty Assessments. The World Bank's strategy for a country is set out in a document called the Country Partnership Strategy. All of these activities are subject to IEG evaluation. IEG rates all projects on a six point scale (from highly satisfactory to highly unsatisfactory) for a number of categories such as relevance, outcomes, and quality of monitoring and evaluation (M&E). It also evaluates country strategies, sector performance, and performance of individual instruments such as Development Policy Loans.⁵

Most recently, IEG carried out an overall evaluation of the poverty focus of World Bank operations (IEG, 2015a), from which this paper is drawn. These evaluations start with a results chain and deploy a range of evaluation instruments to generate evidence on the quality of the Bank's work at each point in the chain. For this evaluation, the results chain examined goes from data, to diagnostics, to country strategy formulation, to strategy implementation (see Figure 1). It is recognized that attribution of the final outcome (poverty reduction) to Bank specific actions is not possible. But each element in the chain can be evaluated using a number of evidentiary tools. Finally, the evaluation looks at feedback loops and learning in Bank processes which better serve to provide a poverty focus to its operations. The full evaluation is reported in IEG (2015a). The focus of this paper, however, is on the feedback loops.

The question asked in this paper is: Did the World Bank have adequate feedback loops to collect and draw lessons from poverty-reduction interventions to improve the effectiveness of country strategies

and programs? A strong mechanism for learning from results can help strengthen the design and implementation of the Bank's projects and programs and improve the effectiveness of its limited resources on poverty reduction. The exploitation of information provided by M&E activities at the project, program, and country levels to feed back into data, diagnostics, and strategy formulation and implementation is therefore essential. We assess these feedback loops and their relationship to the Bank's M&E mechanisms at the project and country strategy levels. The evaluation considers the strengths and weaknesses of the feedback loops, as well as stakeholder coordination and consultation.

The evaluation relies on: (i) an external survey with client government officials and nongovernment stakeholders in selected 20 countries, (ii) an internal survey with Bank staff, (iii) a series of focus group meetings with Bank staff who work on poverty, (iv) 10 in depth country case studies, (v) a synthesis of over 66 Country Partnership Strategies reviews and evaluations. While all of these instruments are referred to in this paper, there is particular reliance on the review for partnership strategies in 66 countries, 10 in-depth country case studies, and Bank staff survey and focus groups. We also rely on IEG data bases which document evaluation scores, and past IEG evaluations.

The 10 country case studies drew in-depth lessons from the Bank's support of government efforts to reduce poverty. The countries were selected from a population of 144 countries comprising all IDA, IBRD, and blend countries.⁶ The selection is purposive and does not aim to fully represent the various categories of countries. It tries to cover a range of countries at different income levels to reflect the differing approaches and challenges to poverty reduction in countries at different levels of development. The case study countries were selected also to roughly reflect regional balance. An emphasis was placed on countries with significant Bank engagement (lending and nonlending activities)⁷. The 10 countries selected for study are Bangladesh, Egypt, Guatemala, Lao People's Democratic Republic (PDR), Malawi, Nigeria, Peru, the Philippines, Romania, and Senegal. Focusing on 2004–2012, each case study consisted of desk reviews, structured interviews with Bank staff, and in-country consultations with stakeholders. A short summary of the case studies, focusing on the feedback loops, is provided in the Appendix to this paper.

The internal staff survey sought insight into staff perspectives of the constraints on data and the drivers of the difference in quality of poverty data and diagnostic work. The survey focused on three areas: constraints to obtaining poverty data; best practices and challenges to creating poverty diagnostic work; and challenges of translating poverty diagnostic work into country strategies. The survey was sent to all professional staff above a certain grade who were working on poverty issues in the Bank's operations and research departments.⁸⁹ Full details are available in Appendix C of IEG (2015a).

Six focus group meetings gathered in-depth information about how the availability of poverty data affects the Bank's poverty diagnostics, and whether and how they translate into country strategies

(Appendix D of IEG, 2015a). The representatives at the meetings included three distinct groups: task team leaders or co-leaders of Poverty Assessments/Poverty Updates, country economists of countries that have not had a poverty assessment since 2009, and task team leaders or co-leaders of country partnership strategies.¹⁰

3. Project Level M&E

As noted above, M&E activities at the project, program, and country levels are essential to strong feedback loops. We start in this section by M&E for projects, and will move to program and country levels in subsequent sections. There are clearly two steps to a successful M&E process: (i) a credible system of monitoring and evaluation and (ii) actual implementation of lessons learnt from M&E. The basic message of this section is that the Bank faces severe shortcomings on both fronts generally and in its poverty focused projects. However, there are some good cases from which lessons could be learnt.

Deficiencies in the M&E design for projects are most frequently identified as shortcomings in Bank support at entry (IEG 2015b). In general, collecting results information from projects has been weak. Between 2007 and 2013, among the 1,841 projects for which IEG assessed the M&E frameworks, 54 percent were rated “modest” and 15 percent were rated “negligible.” Only 31 percent had M&E frameworks that were rated “substantial” or “high.” There is no discernible improvement over time (Figure 2), leaving two main shortcomings. First, outcomes are not measured as often as they should be, nor are the intended outcomes of Bank projects and programs the focus of measurement, particularly for the groups targeted for poverty reduction. Second, when outcomes are measured there is seldom any effort to attribute them to Bank-supported interventions to reduce poverty.

The design, implementation, and use of M&E in Bank projects and programs can be strengthened considerably from the perspective of poverty focus. Often what gets measured are the project milestones (mainly outputs or readily measured intermediate outcomes) but not the final outcome of poverty reduction, although practices vary. Good practice includes the Philippines Social Fund for Peace and Development project, which tracked improvements in income, food security, literacy rates, enrollment rates, infant mortality, malnutrition, water supply, and market access. In Guatemala, the latest series of fiscal Development Policy Loans included project outputs that are directly targeted to poverty-relevant outcomes,¹¹ there are both poverty-related targets (child health and nutrition) and procedural targets. By contrast, most project-level indicators in Senegal examined outputs only implicitly linked to poverty or tracked the non-income Millennium Development Goals.¹²

In Nigeria, the Bank did not produce substantial information on poverty reduction that would lead to M&E. Poverty was not included in the proposed outcomes and results to be monitored as part of assessment of the Bank's program.

In most of the country case studies, the results frameworks of projects were not linked in a substantive way to the country strategy results framework or results chain. The focus of the monitored indicators on outputs or intermediate outcomes failed to provide sufficient information about the project's impact on poverty reduction. If the objective is reducing poverty at the regional or national level, project-level M&E needs to pay more attention to explicit linkages to poverty reduction and the potential for scaling up interventions to achieve a wider effect. These findings confirm the results of a recent IEG evaluation, *Learning for Results in World Bank Operations: How the Bank Learns* (2014a), which indicates that lessons from project experience are not systematically used or developed at either initiation or completion. Implementation completion reports (ICRs), a main instrument for learning, also are generally weak in documenting and drawing lessons on poverty reduction.

Lessons in the ICRs were often too general to be useful and had limited external validity across countries. While useful as information, the lessons were not specific about the implications for poverty reduction. The Senegal case study for this evaluation, for example, found that the lessons from ICRs included the need for government ownership, dealing with institutional issues early in the project design, setting up an adequate M&E system with appropriate baselines and indicators, and moving to multidonor and harmonized budget support. Most staff, the IEG learning study found, viewed ICRs as an accountability tool focused on project ratings rather than learning (IEG 2014a). And though reading the reports before designing projects could help prevent the repetition of mistakes, the lessons from ICRs were often only copied into appraisal documents without adjusting project design.

4. Country Level Results Monitoring and Learning

Moving the M&E perspective to the country level presents a number challenges, including greater difficulty in attribution but also direct and indirect channels of poverty reduction. For example, cash transfers may have a direct impact on poverty. But the impact of access to infrastructure is much more indirect and difficult to establish causally. However, what should be clear is that the first requirement is to actually monitor poverty and poverty related indicators at the country level in country level strategy (as opposed to project specific) documents. The second requirement is to make causal arguments linking the Bank's country strategy to poverty focus via these direct and indirect channels. Our evaluation finds mixed results on this front, although once again there are some good examples to learn from.

The monitoring of Country Partnership Strategy results covers a wide range of poverty-related areas, with most attention to education and health, but the monitoring of direct indicators for

poverty is limited. Figure 3 shows the percentage of countries that monitored indicators in areas directly related to poverty reduction, drawing from the 66 cases reviewed. Most country strategies focused poverty-related monitoring on three to seven areas.¹³ The indicator most frequently monitored is basic infrastructure (such as water and sanitation), followed by schooling quality. But only about 40 percent of the cases included the monitoring of a direct “poverty” indicator in the first period, which declined to some 20 percent in the second period.¹⁴

The country case studies conducted for the evaluation show varying experience. In Malawi, for example, the poverty data and feedback from the overall picture fed directly into the monitoring of the strategy and design of the subsequent country strategy. There is constant reference to the dire poverty situation and the disappointment that the poverty context of the country is not changing more quickly. An explicit M&E system is used and referred to in subsequent Progress Reports. However, in many countries, only a few poverty indicators are monitored in the Country Partnership Strategy. For example in Guatemala, the strategy documents reviewed during the period of evaluation present neither poverty indicators (such as headcount poverty ratios) in their results frameworks, nor changes in poverty indicators targeted as part of the M&E framework, though such changes are discussed in the background sections of the strategy documents. The inclusion of more explicit poverty-relevant indicators, and monitoring and tracking them regularly in the strategy updates, would help programs adapt to improve their effectiveness in reducing poverty.

While there was consistency between country strategy objectives and Bank interventions in some countries, it was not always clear how inputs were expected to produce poverty-reduction outcomes. In Nigeria, the 2010–2013 country strategy updated the poverty context and generally observed the importance of non-oil growth for poverty reduction. But it was not clear how the individual strategic components related to the poverty challenges at the national or sector levels. In Guatemala, there was a thematic disconnect between poverty diagnostics and the choice of programs and projects, with an overreliance on development policy lending and limited links to poverty reduction.

Focusing on a small number of monitorable targets, realistic indicators, and good baseline data is the key to success. There are some good examples to be found in the Bank’s work. Guided by lessons from the preceding country strategy review, the Philippines country team committed to strengthening the design and monitoring system for the 2010–2012 country strategy. The team created working groups mapped to each of the country strategy’s objectives. Within these groups, specific teams were assigned to track progress on their objectives. Five full-day workshops held throughout implementation allowed the teams to come together to share their progress. These workshops became part of the monitoring system for the country partnership strategy. As a result, the M&E system improved at both the country program level and the project level, though it continues to focus on the national monitoring system. The country strategy included milestones to monitor progress, and supplemented them with specific and quantifiable indicators for each outcome, an

improvement over the previous system. The main factor driving the difference between the two systems was the commitment of Bank staff and management to enhancing the results focus of their strategies.

Similarly, in Bangladesh, a system in response to the lessons learned from the preceding review was developed. However, though the country management effectively used the results monitoring process to modify and streamline the World Bank program, the regularity of this process declined over time, particularly the element which involved government participation. This was in part due to changes in Bank country management and also to shifts in the country program as well as the Bank's relationship with the government.

5. Pilots, Scaling Up and Feedback Loops

Feedback loops from large ongoing projects or country programs as a whole have been discussed in the previous section. But a strategy of piloting is clearly appropriate given the uncertainties surrounding the development enterprise. However, for this to succeed M&E and feedback loops are again crucial. The pilots have to be designed with M&E at the core, and then the lessons from the pilot have to be incorporated into the scaled up project, or country wide program. Beyond pilots, however, is the question of a comprehensive system of feedback loops at every point in the results chain as shown in Figure 1. A main weakness of the Bank's feedback loops is that M&E of individual interventions often fail to provide broader insights to feed back into country strategies. Although many Bank country strategies articulate poverty links to individual components of the strategy, there is seldom a direct or explicit link between the activity-level outcomes and the country strategy "higher-level" objectives, including scaling up of interventions.

Piloting and scaling up of interventions are occurring in some countries. In Senegal, several pilot cases were designed for Bank operations encouraging the scaling up of small or pilot projects. For access to land, a pilot activity was envisaged in the 2003–2006 country partnership strategy. The aim was to introduce market-based mechanisms for land allocations and, once proven successful, to scale them up. The 2007–2010 strategy supported pilot projects in education and health to provide performance-based incentives and to motivate key staff to relocate to underserved regions of the country. During the global financial crisis, the Bank scaled up its earlier pilot under the Nutrition Enhancement Project in the context of its Emergency Nutrition/Cash Transfer Project.

In the Philippines, the Bank focused its support primarily on piloting and scaling up the conditional cash transfer program and the community-driven development programs.¹⁵ The lessons from these pilots, and from the various other learning methods, helped strengthen the design, implementation, and scaling up of projects, enhancing the poverty focus of the Bank's projects. The Bangladesh strategies explicitly identified building on good performance during the previous period for the Reaching Out-of-School Children Project. Initially funded as a \$50 million "pilot," it received additional financing of \$30 million and was followed by a second project of \$130 million.

The evidence is thin, however, on whether successful pilots were used and whether they leveraged non-Bank resources, compared with a general expansion through additional financing. From 2005 to 2014, 14 percent of the Bank's \$233 billion in investment lending went to additional financing.¹⁶ IEG valued additional financing for investment lending to the Transport and ICT sectors and found that nearly half of additional financing was used for the purpose of scaling up, as opposed to addressing cost overruns and financing gaps. (IEG 2015c). The focus group meetings suggested that although most strategy documents stated that the lessons from reviews of previous strategies were considered in developing the current strategy, there often was no direct evidence to that effect. The strategy documents often only referred to the lessons in the main text, but did not indicate how and where these lessons were taken on board—or how the lessons may have changed or affected strategies. The Senegal 2003–2006 country strategy refers to two key lessons from the review of the previous strategy: more aid is a poor substitute for better aid, and the financial management and procurement faces serious problems in Senegal. However, it did not link these lessons to the measures it proposed. The focus groups indicated that while formally the Bank takes steps toward learning lessons from the previous strategy, and in some cases even convenes action or lessons meetings with the country management units, usually the new strategy depends heavily on the existing project pipeline, the government's national agenda, and at times the preferences or priorities of the country director.

There are some good examples, however. Continual learning and strong feedback loops can go a long way in strengthening the poverty focus of the country programs, as in Lao PDR. The Bank's country team produced, or helped produce, sufficient evidence on poverty reduction and made good use of it in the design, implementation, and evolution of the poverty focus of the country program. Adequate poverty data, and good and extensive poverty diagnostics, provided strong analytical underpinning. The programmatic nature of the Poverty Reduction Support Operations facilitated the evolution of the country program and its poverty focus.

The strength of feedback loops in a country varies along the results chain from data, to diagnostics, and to strategy formulation and implementation—and across sectors. In Nigeria, the lack of country champions demanding poverty data or diagnostics is a major reason for the incomplete feedback loop from results back to data and diagnostics. Bank-financed poverty-focused interventions were small in scale relative to the problems and the government's own resources, although several demonstrated strong technical approaches to evaluation. Explicit attention to poverty-reduction objectives was either at a high level of generality (as in debt relief and non-oil sector growth programs) or detailed in a subset of the program (as in community-driven development programs). The Bank program did monitor the Millennium Development Goals, which include an indicator on income poverty. However, in general, the Bank did not produce substantial information on poverty reduction that would lead to effective M&E. In neither of the country strategies reviewed was poverty explicitly included in the proposed outcomes and results matrix to be monitored as part of the assessment of the Bank's program.

In Bangladesh, the strength of feedback loops varied across sectors. In some cases they are strong, as in the social protection program in which a history of good analytic work contributed to a well-prioritized

set of operational recommendations (focusing on efficiency, efficacy, and targeting), which then formed the basis for dialogue with the key implementing agencies and project interventions when circumstances were ripe. Poverty-focused feedback loops have been weaker in infrastructure lending, although there is an increasing interest in these sectors (notably rural roads and rural electrification, as well as due to environmental sustainability issues) in drawing on factors as the priorities of Bank management and country teams and such external factors as the political commitment and administrative and technical capacity of counterparts. M&E in project implementation also varies considerably with the incentives and skills of staff. ¹⁷ Evidence also suggests much more needs to be done to integrate knowledge from evaluations into staff practices and the project cycle (IEG, 2014b).

6. Stakeholder Consultation and Coordination

A key mechanism of effective M&E is stakeholder consultation, at the time of intervention design, implementation and evaluation. How do those affected by the intervention, the direct beneficiaries as well as government officials, assess the outcomes and the process? Any evaluation must focus on two steps—whether the mechanisms are in place to collect input, and whether the input is then absorbed and acted upon. We find that while the Bank is getting better at the first, there is still a way to go on the second.

Most Bank country strategies include some participatory consultations with both government and nongovernment stakeholders. The experience, however, is mixed. In Guatemala, all three country strategies involved extensive consultations and resulted in shifting the emphasis in the proposed programs. Changes to the 2005 strategy document increased emphasis on environment across Bank-supported activities. They also broadened a proposed Local and Rural Development Project to include basic infrastructure services, such as water, sanitation, electrification, and information and communication technologies. And they sharpened the focus on human development, infrastructure needs, and access to finance in indigenous communities.

In Senegal, the preparation of the country strategies included extensive consultations with government, development partners, the private sector, and civil society to ensure that the poverty policies and priorities would be well thought out and broadly supported. The 2003–2006 strategy asserted that the Bank would seek to ensure better country ownership of the poverty-reduction agenda through closer policy dialogue, especially with civil society. Along with extensive public consultation on the development of the strategy, several Bank operations used participatory and community development methods as inputs to define local priorities.¹⁸

However, focus group discussions with Bank staff noted that in many cases there was no clear evidence that consultations had a significant effect on either the design or the implementation of Bank strategies. They were often treated as an opportunity for Bank staff to inform the government and other stakeholders of the proposed strategy and interventions. The limited evidence available from the strategies and other documentation indicates that suggestions from stakeholders were not fully

taken on board. The consultations usually followed a formal process, often late in the strategy formulation process, and partly due to the tight timetable.

In Peru, the topics discussed in the consultations differed from the major directions of the strategy in areas of relevance to reduce poverty. Multiple consultations were carried out with civil society for the 2007 strategy, in addition to consultations with the incoming and outgoing authorities and with the private sector. In different parts of the country, they focused on good development practices and income generation for the poor. But the topics discussed were not related to public spending at the local level, to access to services, or to a new social contract in health and education, a major area in the country partnership strategy.

The survey of stakeholders in 20 client countries¹⁹ indicates that the Bank's coordination between donors and the concerned government needs further strengthening. Only about 57 percent of government respondents agreed strongly or somewhat that the World Bank coordinates priorities between donors and the government, while nearly a third of respondents disagreed strongly or somewhat with this statement. When donors were asked whether the World Bank coordinates priorities between the donors and government, only a little over half (53 percent) agreed with the statement, of which only 11 percent agreed strongly. At the same time, around 44 percent of donor respondents disagreed with the statement. This question had the highest total percentages of people disagreeing with the statement both among the government officials and the donors. The stakeholder survey results also show that the Bank seeks feedback more frequently from donors compared to other stakeholder groups.

Conducting meaningful and well-informed consultations in the short timeframe for preparing a country strategy is difficult, according to staff at focus group discussions. Identifying stakeholders who know the Bank well for consultation can be a challenge. In some countries, the Bank relies on the government to invite stakeholders to consult on the country strategies, possibly clouding the transparency of the selection process. Finding the right stakeholders is even more difficult in fragile and conflict-affected states, where inviting stakeholders from across the country may preclude safety and security issues.

7. Conclusion

Did the World Bank have adequate feedback loops to collect and draw lessons from poverty-reduction interventions to improve the effectiveness of its country strategies and programs? To answer this question, this paper has examined feedback loops in the World Bank's support for poverty reduction in its country programs over the period of 2004–2012. The key findings of this evaluation concerning the feedback loops are summarized in Table 1.

At the strategy level, feedback loops tend to focus on “checking the box” without an assessment of whether a real difference is being made to poverty. In both cases, the processes are not systematically integrated in the strategy or in individual projects. Project and program-level M&E are most effective when they measure outcomes and inform the design and implementation of country strategies,

providing a basis for scaling up support to better leverage resources. Improving the use of poverty data in project M&E to improve planning and implementation is crucial. Finally, the formal process for preparing a country strategy often includes some form of participatory consultation. However, there is limited evidence that such consultations have had strong effects on either the design or implementation of Bank strategies during the review period.

Country level evaluative evidence strongly suggests that while the quality of poverty-related data support and diagnostic work by the Bank has been relatively strong, in-country capacity limitations and other constraints, such as budgetary pressures, limited the Bank's effectiveness. In a majority of the country case studies, feedback loops were found to be relatively weak, often as a result of inadequate monitoring and evaluation systems at the project and program levels.

Specific recommendations of feedback loops which follow from the evaluation are firstly, to develop and adopt explicit evaluation protocols for piloted interventions to capture lessons from experience on poverty reduction, with a view towards opportunities for scaling up successful interventions. Secondly, Bank staff need to ensure attention at project inception to evaluability through (1) developing standards for baseline measurement, (2) explicit linking of the baseline to indicators relevant to project objectives, including any that refer to poverty or inclusion impacts, and (3) robust planning for monitoring data required for ex-post evaluation.

Appendix: Summary of 10 Country Case Studies 2002-2012

Fuller Summaries are available in IEG (2015a, Appendix A).

Bangladesh The sequence from data to diagnostics to strategy formulation and implementation varied across sectors. In some cases, feedback loops were strong. In the social protection program, for example, a history of good analytic work (feeding into diagnostics work) contributed to a well-prioritized set of operational recommendations that then formed the basis for policy dialogue. Feedback loops were also relatively strong in education. Poverty-focused feedback loops were weaker in infrastructure lending. The Bank could have devoted more attention to the challenge of poverty monitoring between the household income and expenditure rounds, and a programmatic approach to poverty assessments might have provided more timely inputs into strategy formulation. The results chain could have been more explicit in sectors that have a more indirect influence on poverty reduction. Had the strategies presented and analyzed poverty reduction more rigorously, the poverty focus would likely have been more clearly linked to the growth objective, with stronger results.

Egypt Feedback loops in Egypt were affected by the fact that poverty data were not fully accessible during the period under review and the data that were made available may not have fully captured the new type of poverty that has been growing around metropolitan areas and in major shanty towns.

Although the Bank's poverty diagnostics were generally of good quality, the data used may not have provided the full picture. Moreover, during much of the period under review, the authorities did not allow the Bank to prepare some of the needed analytical pieces, such as Public Expenditure Reviews. Although the strategy formulated by the Bank over the years attempted to include some focus on poverty with a reasonable results chain for reducing poverty, the Egyptian authorities resisted focusing on poverty and borrowing for social sectors project, which may have undermined the Bank's strategy.

Guatemala Feedback loops in Guatemala were not evenly strong in all areas. The Bank seems to have done an excellent job in supporting the generation of poverty data and in preparing poverty diagnoses over the past decade. As a result, lack of adequate data and diagnostics are no longer major obstacles to addressing poverty in Guatemala. The strategies and the choice of lending and nonlending operations appeared generally well aligned with the poverty diagnostics; a thematic disconnect between poverty diagnostics and the choice of programs and projects does not stand out as a major problem. The one area in the feedback loop where the Bank's support for antipoverty efforts appears to have been least successful during the past decade is country strategy implementation. The result was an overreliance on development policy loans with limited links to poverty reduction.

Lao PDR Feedback loops in Lao PDR were strong. Given the programmatic nature of most of the core elements of the poverty reduction focus of the country program, there has been a continual learning process and feedback loop. The programmatic nature facilitated the evolution of the country program and its poverty reduction focus. The Bank and other development partners worked intensively to improve the quality and accessibility of statistical capacity in Lao PDR. Strong Bank and development partner support also played an important role in improved monitoring and evaluation (M&E) capability in several Bank-supported projects and activities in Lao PDR.

Malawi Feedback loops in Malawi were strong. Progress was made in maternal and child health and nutrition, moderately poor households moved out of poverty through farm and nonfarm diversification and improved access to irrigation and other agricultural services, and there was no repeat of famine. Yet the poverty challenges have only increased over time, particularly as population growth puts further pressure on limited land, with both rural inequality and the share of the ultra-poor growing.

Nigeria Feedback loops were incomplete in Nigeria. No Nigerian champions demanded data or diagnostics. The Bank-financed poverty-focused interventions were of small scale relative to the scale of the problems and the government's own resources, although several demonstrated strong technical and interpersonal approaches to evaluation. Evidence on poverty reduction in Nigeria was modest. Explicit attention to poverty-reduction objectives was either at a high level of generality (as in debt relief and nonoil sector growth) or detailed in only a subset of the program (as in community drive development programs). The Bank program for Nigeria did monitor the Millennium Development Goals, which include an indicator on income poverty. In general, however, the Bank did not produce substantial information on poverty reduction that would lead to M&E. In neither of the strategies under review was poverty

included in the proposed outcomes and results to be monitored as part of assessment of the Bank's program, including within a sectoral context.

Peru The diagnostic reports prepared by the Bank covered the most relevant poverty issues in Peru. Overall, these studies were of a very good quality in terms of meaningful use of empirical evidence (complemented with good-quality statistics), relevance and timeliness, depth of analysis, and identification of policy directions. The most recent strategy had a stronger link to poverty in Peru and better reflected the findings and recommendations of the Bank's diagnostic work. A key issue was the significant divergence between the planned and implemented portfolios. The situation improved in more recent years, and there is now strong complementarity between the Bank's poverty-related lending and nonlending activities. Nevertheless, in several key areas, such as the policy steps supported by development policy loans, there are no details on specific policy steps to be supported by development policy loans. The 2006 strategy included no efforts to develop a results chain linking the operations to objectives in this area. Where the strategy did envisage operations to reach the rural poor, it lacked a result chain for addressing the issue.

Philippines The Bank's poverty diagnostic works were of high quality and provided strong analytical underpinnings for policy making and strategy formulation. However, the timeliness and quality of poverty statistics constrained monitoring the progress of poverty reduction. The absence of a full Poverty Assessment or Poverty Update since 2001 limited the depth of the work in certain aspects, including the identification of the drivers of poverty at a disaggregated level and the tailoring of recommendations to overcome obstacles. There were also significant deviations between the envisaged and implemented country programs. Although the M&E system improved at both the program and the project level, it continued to focus mainly on national-level and intermediate outcomes. There is a need to strengthen the design of the feedback loop system to more closely monitor the intended outcomes of Bank efforts rather than the outputs of intermediate outcomes.

Romania The Bank closely monitored overall poverty reduction outcomes in Romania. Evidence from the Poverty Assessments and other diagnostic work, including evidence on poverty drivers as an underpinning for support to disadvantaged groups, informed the design of its programs. The 2006 and the 2009 strategies articulated and included poverty-related outcome targets for its projects and covered extreme poverty. More systematic measurement of poverty impacts might have strengthened the feedback loops that help inform the poverty content of new programs and operations. The feedback loops were strong in response to findings from analytical work, perhaps less so from project M&E. Feedback loops from analytical and advisory contributions worked primarily because the Bank has been a credible counterpart that built its reputation on poverty issues over the years with a strong record of work on data, poverty measurement, and poverty diagnostic issues. The Bank could perhaps learn more about poverty by strengthening the poverty M&E in projects and extracting more lessons from its project experience.

Senegal Implementation of Bank interventions was broadly consistent with the available poverty data and diagnostics as well as the Bank’s strategy. Projects that focused on rural areas, basic education, and the vulnerable parts of the population were particularly consistent with the poverty data. Budget support operations were key instruments for poverty reduction, but there was no planned dialogue or conditionality regarding the reallocation of public spending toward programs reaching the poor. Projects that focused on rural areas, basic education, and the vulnerable parts of the population were particularly consistent with the poverty data. The Bank provided strong support for generating good-quality poverty data and diagnostics. The government appeared to be committed to poverty reduction and made good use of the technical support provided by the Bank (and other donors) for its poverty data, poverty diagnostics, and preparation of its strategies. However, feedback loops from data to diagnostics to strategy formulation and implementation in Bank country strategies were weak, and there is a widespread belief that the Bank’s strategy was not closely monitored by the government or by the Bank.

NOTES

¹ The findings, interpretations, and conclusions expressed in this paper are entirely those of the authors. They do not necessarily represent the views of the International Bank for Reconstruction and Development/World Bank and its affiliated organizations, or those of the Executive Directors of the World Bank or the governments they represent.

² This paper focuses on the two arms of the World Bank Group which lend to member governments, the IBRD and IDA.

³ See more details in World Bank 2013. https://openknowledge.worldbank.org/bitstream/handle/10986/16095/32824_ebook.pdf. It is in this context that the World Bank’s new strategy introduced in 2013 a second corporate goal for supporting developing countries with the aim of boosting shared prosperity by raising income growth of the bottom 40 percent of population in every country in a sustainable manner.

⁴ The population includes 144 countries, listed as Bank borrowers as of October 2013.

⁵ These evaluation ratings have been widely used in many academic papers, for example to assess the correlates of project success (Denizer, Kaufman and Kraay, 2013). Similar ratings scales are used by other agencies such as the Asian Development Bank and these have been analyzed as well (Bulman, Klkma and Kraay, 2016). A recent paper by Estelle Raimondo (“What Difference Does Good Monitoring & Evaluation Make to World Bank Project Performance?” Policy Research Working Paper 7726, Washington DC, World Bank, June 2016) using data from 1,300 World Bank projects evaluated between 2008 and 2014, finds that the quality of monitoring and evaluation is significantly and positively associated with project outcome (as measured by the Bank and rated by IEG).

⁶ The IBRD, IDA, and blend country classification is up to date as of October 2013.

⁷ Significant levels of Bank engagement are indicated by a minimum of 25 approved projects between FY2004 and 2012, since 25 projects is the median number of projects for the population of the 144 countries during this period.

⁸ The survey was conducted from April 15 to May 13, 2014, and was sent to 4,150 Bank staff, of which 866 responded—a rate of 21 percent, on par with WHO perception survey standards (see http://www.who.int/about/who_perception_survey_2012.pdf). To focus on staff with close experience in

operations and country strategies, staff mapped to procurement, human resources, information and technology, business solutions, World Bank Institute, and IEG were excluded. The survey was confidential and anonymous. See Appendix C of IEG (2015a) for details.

¹⁰ The 18 countries represented in the discussions were purposively selected to cover all Regions considering the balance between the types of countries by lending group, accessibility of data, and FCS and non-FCS countries. The selected countries were Afghanistan, Botswana, Cambodia, the Democratic Republic of Congo, Jordan, India, Indonesia, Kosovo, the Kyrgyz Republic, Moldova, Pakistan, the Republic of Yemen, Russia, South Sudan, Sri Lanka, and Papua New Guinea, along with West Bank, Gaza, and the member countries of the Organization of Eastern Caribbean States. although all of the participants from relevant focus group categories in each country were invited to participate, the final list depended on the staff availability in June-August 2014. The total number of focus group participants was 22 staff members.

¹¹ In addition to specific targets for the Tax/GDP ratio, which are ultimately meant to place public social spending on a more sustainable basis, the operation also has as outcome targets: (i) the percent of children under 1 year in 83 municipalities receiving the basic health/nutrition package, and (ii) the number of Zero Hunger Plan (*Plan Hambre Cero*) offices that have been established in the country to coordinate nutrition initiatives.

¹² Of the projects reviewed, the subset of lending interventions for which poverty-specific data were collected included the Community and Social Development Project and the Community Poverty Reduction Project.

¹³ Out of the 66 countries reviewed, which have two strategies completed and reviewed during the period of evaluation, 48 monitored three to seven areas with direct poverty focus in the first period reviewed, while 58 monitored three to seven areas during the second period reviewed.

¹⁴ Full details on all of these calculations are available in Appendix F of IEG (2015a)

¹⁵ The program was initially piloted with 6,000 households in 2008. By 2009 it had been scaled up to 376,000 households, and it is currently being expanded nationally. To complement the initiative, the Bank also supported the development of the National Household Targeting System for Poverty Reduction which has become the main system of identifying the poor, providing objective information for the conditional cash transfer, community-driven development, and national health) projects.

¹⁶ The Board has approved 608 additional financing projects with a total volume of \$32.7 billion, representing 14 percent of a total of \$233 billion in investment lending during June 2005–June 2014. Data source: World Bank Business Warehouse (database).

¹⁷ Annual evaluation reports of Bank project performance have drawn attention to severe shortcoming of M&E quality for decades, most recently in IEG's Results and Performance Report (IEG, 2015).

¹⁸ The operations included the Urban Development and Decentralization Program, the National Rural Infrastructure Program, and the Social Development Fund.

¹⁹ The final list of survey countries included China, Democratic Republic of Congo, Dominican Republic, Ethiopia, Ghana, Haiti, Honduras, India, Jordan, Kosovo, Kyrgyz Republic, Mexico, Morocco, Nepal, Papua New Guinea, Russia, Rwanda, Sierra Leone, South Africa, and Yemen. For the distribution of selected countries by type and the corresponding response rates, please refer to the lists of survey countries by type and survey responses by country (IEG 2015 Annex tables B.6 and B.7). The survey targeted several groups including government officials, civil society, academia, donor/international community, and private sector. The heavier weight in the respondent list was given to government officials as they are World Bank's primary clients.

Ravi Kanbur is T.H. Lee Professor of World Affairs, International Professor of Applied Economics and Management and Professor of Economics at Cornell University.

Xubei Luo is Senior Economist in the Poverty Global Practice of the World Bank.

Mark Sundberg is Chief Economist of the Millennium Challenge Corporation.

The authors were part of the team which worked on the report *The Poverty Focus of Country Programs: Lessons from World Bank Experience* (IEG 2015a), produced by the Independent Evaluation Group of the World Bank. This paper is based on that report.

Figure 1. Evaluation Chain for the Poverty Focus of Country Programs

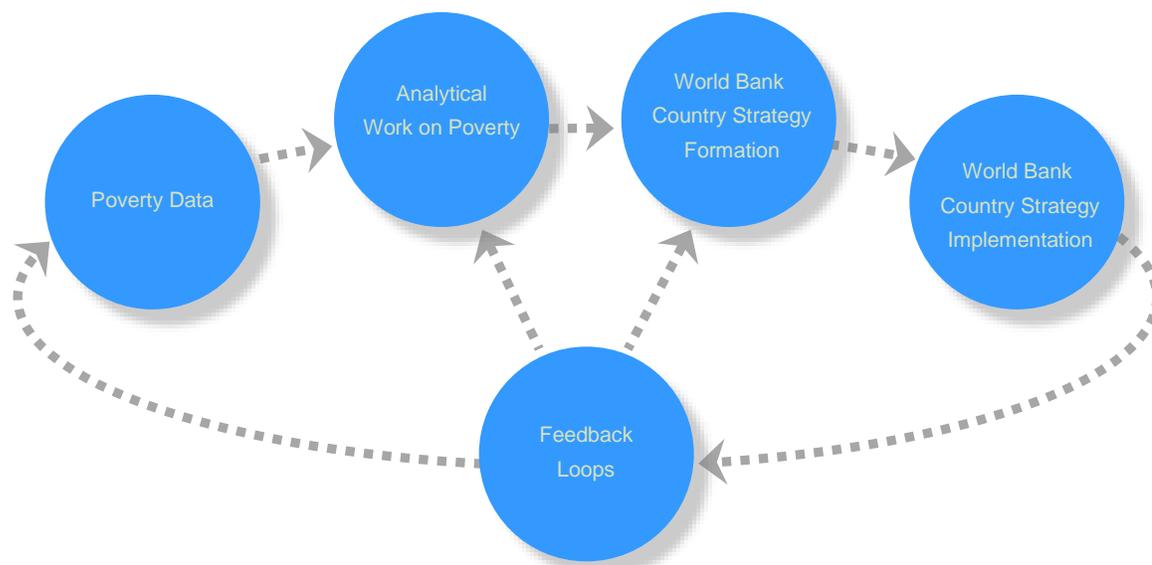

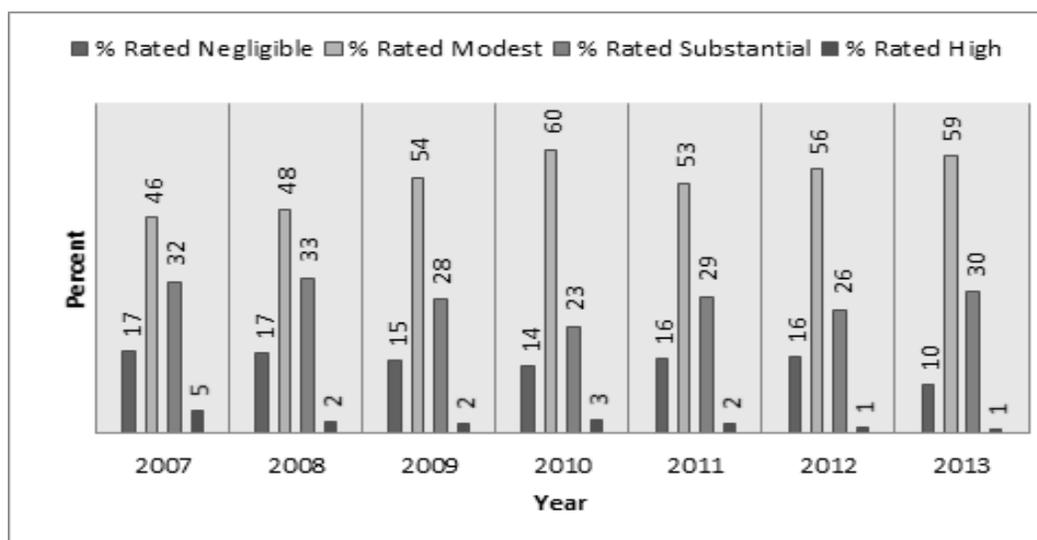

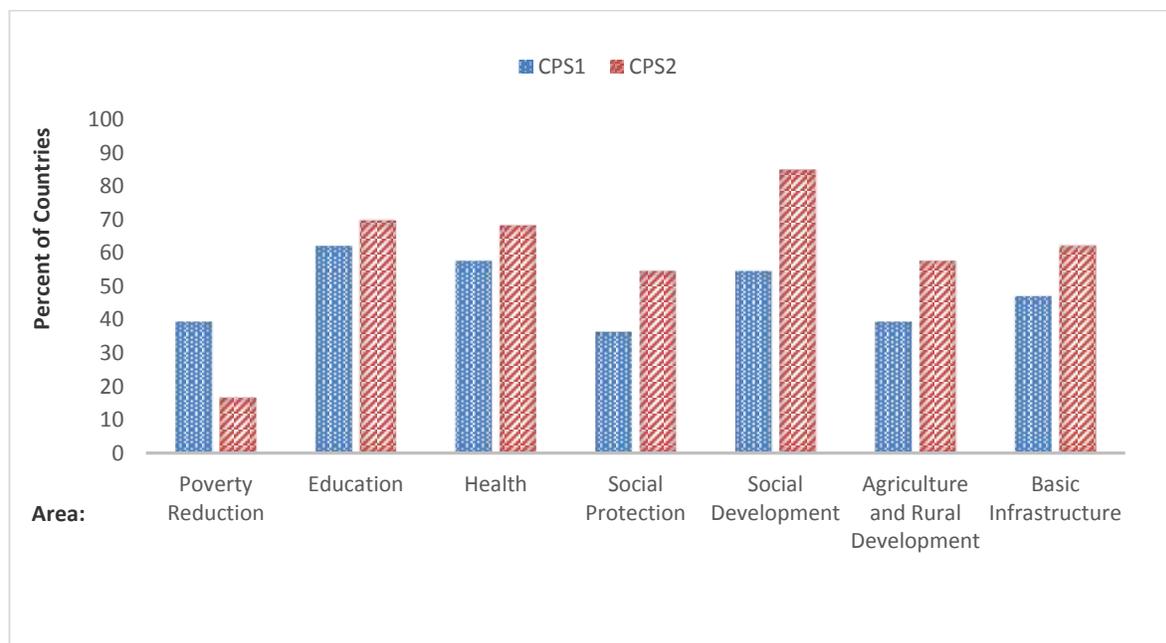

Figure 2. IEG Project M&E Ratings

Source: IEG Results and Performance Database.

Note: The data are based on the number of rated projects that received ratings of negligible, modest, substantial, or high as a percentage of total projects rated (excluding those deemed not evaluable). Fewer than 55 percent of projects were rated in 2000–2006, and so were excluded from the analysis. In 2007–2013, 98 percent of projects had M&E ratings.

Figure 3. Country Monitoring of Poverty-Related Indicators

Source: World Bank Database.

Note: The figure shows the percentage of countries that monitored at least one indicator in areas directly related to poverty reduction from the 66 country strategies reviewed, which have completed two rounds of Country Partnership Strategy Completion Report Review during the period of 2004-2013. CPS1 and CPS2 refer to the sets of countries in the first and second round of the review, respectively.

Table 1: Summary of Key Findings

Key Components of Feedback Loop Evaluation	Scope of Evaluation	Period of Evaluation	Key findings concerning feedback loops
1. Project Level M&E	IEG review of 1841 projects' quality of Monitoring and Evaluation	2007-2013	Overall, collecting results information from projects has been weak. Among 1841 projects for which IEG assessed M&E, only 31% were rated "substantial" or "high," 54% were rated "modest" and 15% were rated as "negligible" in terms of the quality of their M&E. There is no discernable improvement over time or since 2013.
2. Country Level Results Monitoring and Learning in areas related to poverty	IEG review of 66 countries' strategy completion reports, focusing on links to poverty reduction	2003-2012	Overall, monitoring of direct indicators for poverty was limited. Only between 20 to 40% (depending on period covered) of the 66 cases monitored direct poverty indicators. The extent of monitoring varied substantially across sectors and countries. Sectors with highest rate of monitoring (e.g. infrastructure) had only indirect effect on poverty. Baseline data was not collected in many cases, and the data collected were not always directly rated to poverty outcomes.
3. Country Case Studies	IEG in-depth of assessment of poverty focus, including feedback loops, of 10 country feedback loops	2003-2012	Among the 10 country cases studied, there were considerable variations at both country level and sector level. Overall, only two countries or 20% of the sample (Lao PDR and Peru) had a relatively strong feedback loop from results to data, to diagnostics, to country strategy, to implementation, to results. On the other hand, five countries (Bangladesh, Guatemala, Malawi, Philippines, and Romania) had a modest feedback loop, and two countries (Egypt and Senegal) had a relatively weak feedback loops. Feedback loops in Nigeria were also incomplete.
4. Stakeholder Consultations, focusing on feedback loops	IEG conduct of external stakeholder survey in 20 client countries on the World Bank's support for poverty reduction (279 responders)	2013-2014	Overall, the survey result for stakeholders in 20 client countries indicates the following response to the question "to what extent does the World Bank seek feedback from government, external donors, academics civil society, private sector and other?": the Bank, as perceived by its clients, tends to seek feedback more frequently from other international development institutions and bilateral donors than from key within country stakeholders. About 71% of government respondents agreed strongly or somewhat that the Bank seeks feedback from other donors compared with 56% for academia and 65% for civil society, and 53% for private sector. Both government officials and other stakeholders responding to the survey felt that the World Bank seeks feedback while developing its country strategies more frequently from external donors.
